

DAIMLERCHRYSLER

Representation and Management of Reified Relationships in Protégé

Tania Tudorache
7th International Protégé Conference
Bethesda, 9. July 2004

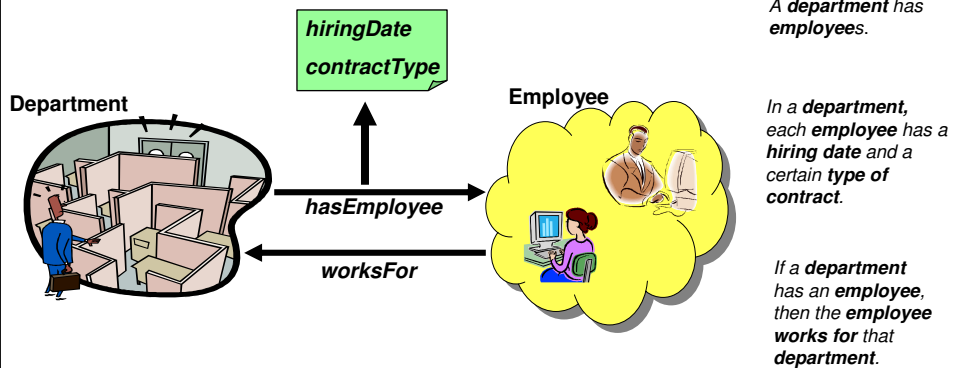

Research and Technology

DAIMLERCHRYSLER

Overview

- From simple to reified relationships
- Problems
- Patterns for modeling reified relationships
- Tool Support

The context: From Simple to Reified Relations

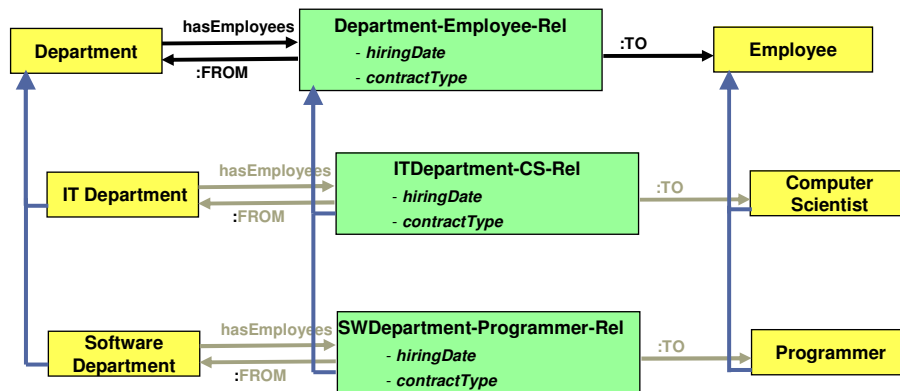

What is a reified relation?

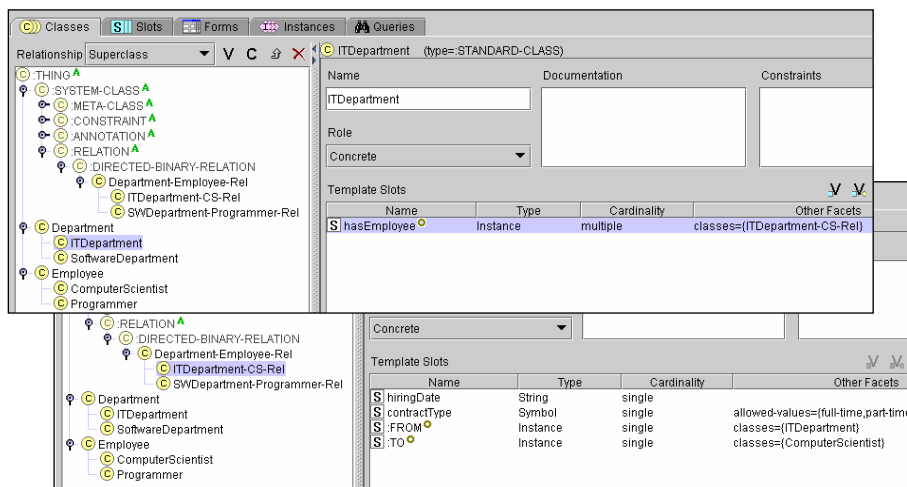

- **Reification:**
 - *Def:* Treating an **abstract concept** as if it were a **real, concrete thing**
- **Knowledge representation:**
 - used to represent facts that must then be **manipulated** in some way
- **RDF(S):**
 - a statement attached as a property to another statement

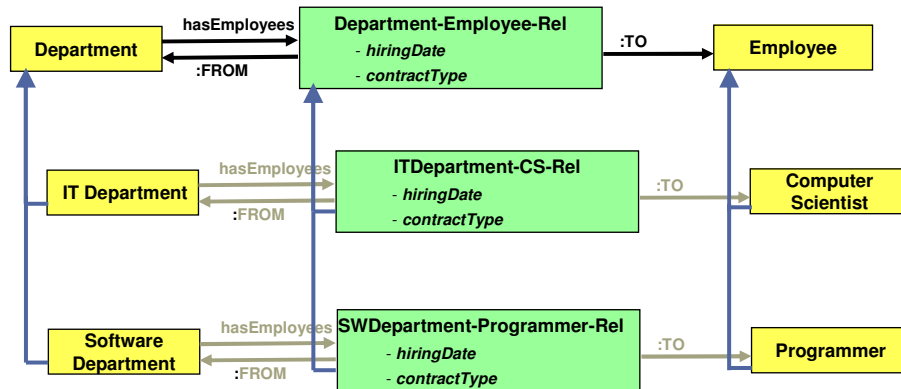

A Simple Scenario: Building departments

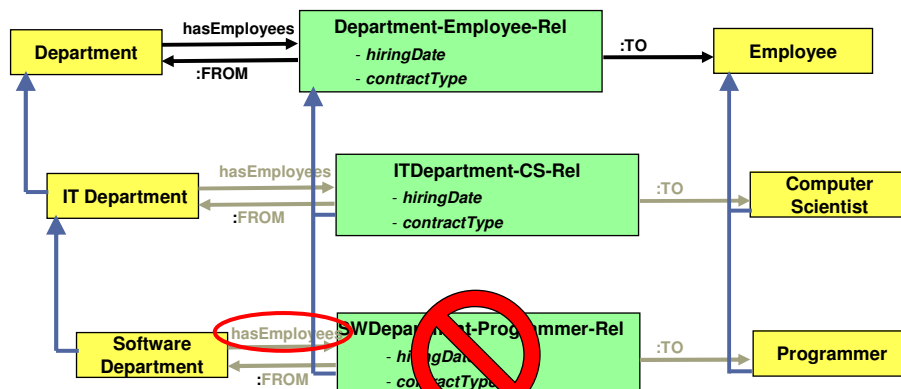

A Simple Scenario: Screenshot of Protégé GUI

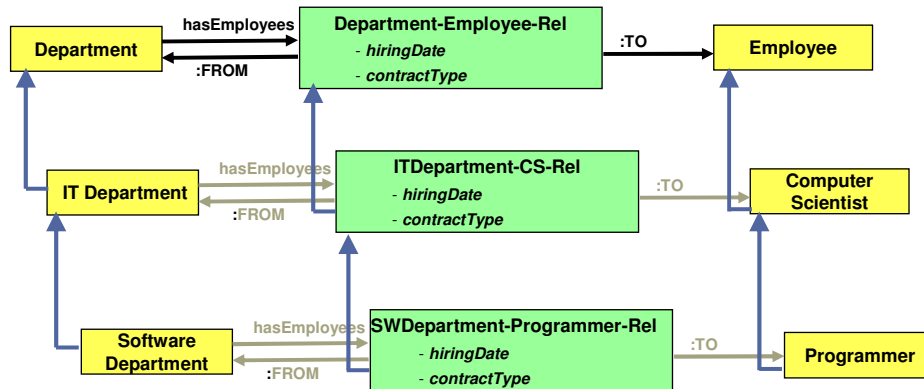

A Simple Scenario: Building departments

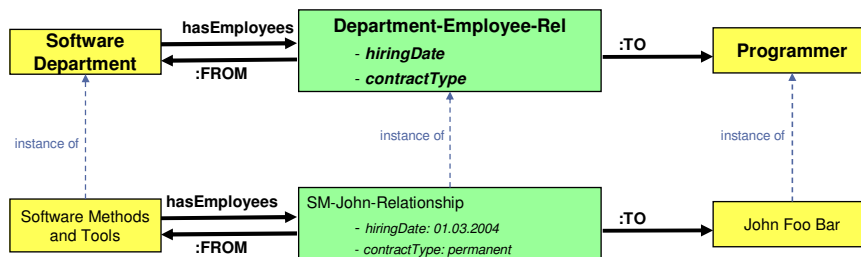

A Simple Scenario: Changing the class taxonomy

A Simple Scenario ... becoming consistent

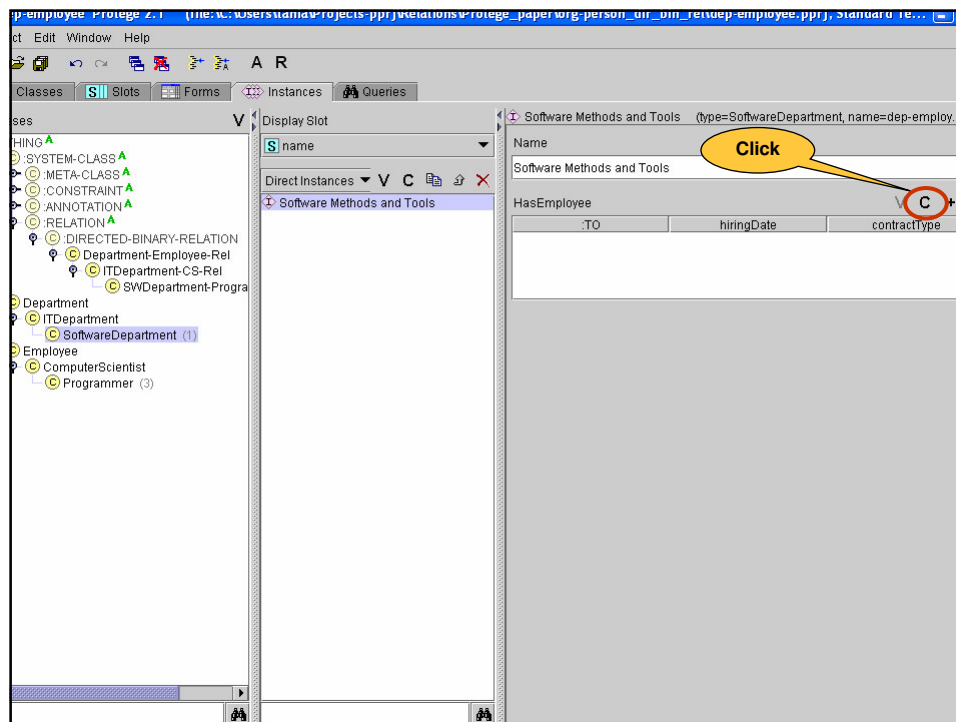

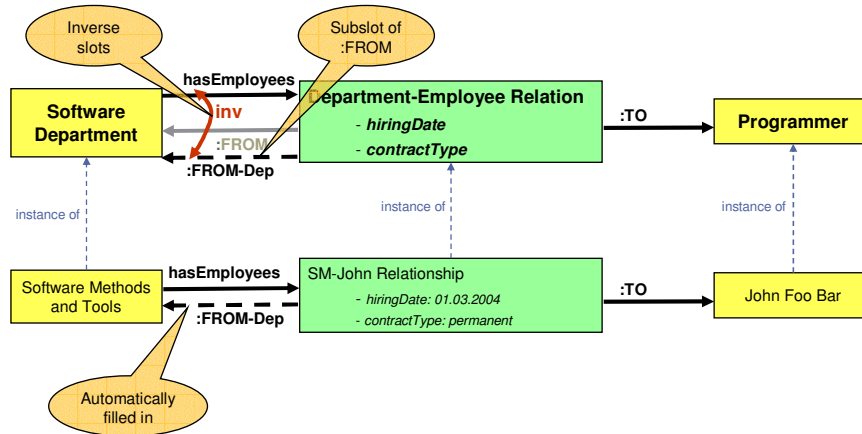

Another Simple Scenario: Deleting a related instance

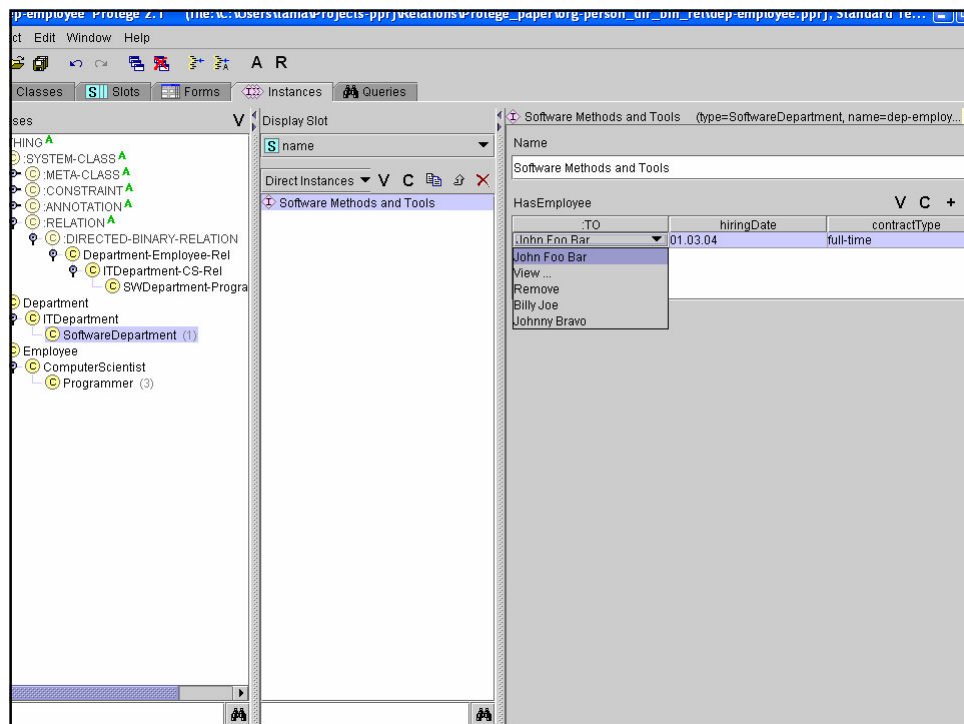

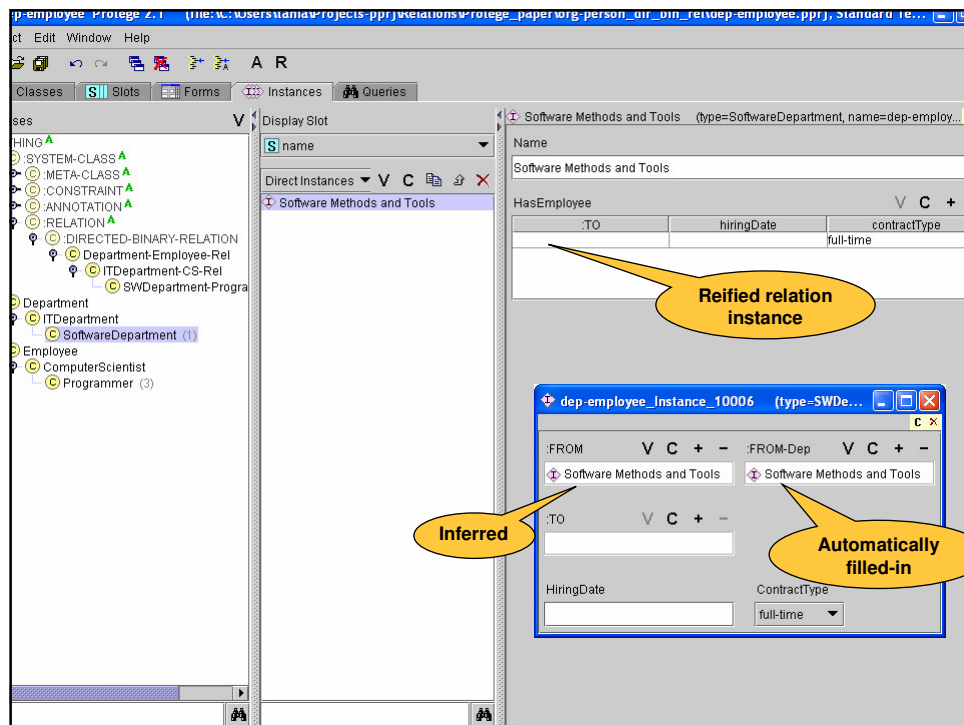

What should happen at deletion?

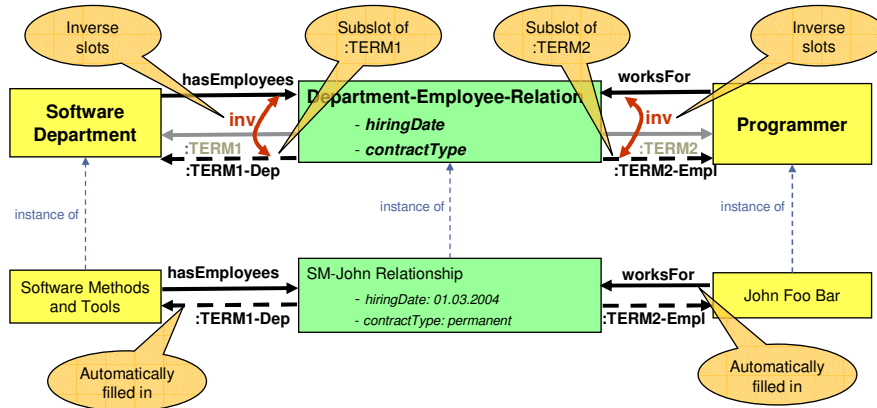

- Delete incomplete relation instances?
- Delete incomplete relation instances and related instances?
- Deletion should not be allowed?

The directed binary relationship – Extending the Modeling Pattern

The bidirectional inverse relationship - The modeling pattern

Display Slot

Software Methods and Tools (type=SoftwareDepartment, ...)

Name: Software Methods and Tools

HasEmployee

:TERM2-Employee	hiringDate	contractType
John Foo Bar	01.03.04	full-time

User Filled-in

DAIMLERCHRYSLER

Display Slot

John Foo Bar (type=Programmer, name=dep-employee_I_...)

Name: John Foo Bar

WorksFor

:TERM1-Dep	hiringDate	contractType
Software Methods and Tools	01.03.04	full-time

Automatically filled-in

Relationship instance

dep-employee-inv_Instance_1 (type=SWDepartment-Progra...)

:TERM1	:TERM1-Dep	:TERM2	:TERM2-Employee
Software Methods and Tools	John Foo Bar	John Foo Bar	John Foo Bar

HiringDate: 01.03.04
ContractType: full-time

What tool support is needed?

- **Modeling patterns for other types of relations**
 - Bidirectional inverse relation
 - N-ary relationship
- **Definition support at class level**
 - Automations that create all the necessary structures and fill them in correctly
 - Specialized widgets that support the definition of reified relations
- **Usage support at instance level**
 - Visualizations and editing plug-ins
- **Consistency check**
- **API Support for reified relationships**

Conclusions

- Reified relationships add more expressiveness to your ontology
- ... but:
 - They are hard to manage
 - They involve extra effort in keeping consistent
- That's why we need:
 - Automation support for repetitive operations (e.g. creation, deletion, etc.)
 - Specialized GUI-s
